**Mission #10 Assignment**
IS 413 – Hilton

For this assignment, we will be rejoining our old friends, Barbara & David Fournier and the rest of the Bowling crew from the Bowling League Database. We are going to build a website that lists out the information about the bowlers in the database. The database can be downloaded here:

https://byu.box.com/s/4o6737azcrhv04desaanjcebsywbpgis

The database should be set up using the Repository Pattern in ASP.NET. You will set up a ASP.NET API for the React app to consume to list the bowler data. React & ASP.NET should work together to display the necessary data.

The app should display the following information about each Bowler in the database:

- Bowler Name (First, Middle, Last)
- Team Name
- Address

- City
- State
- Zip
- Phone Number

Create a heading component for the web app that describes what the page is about. Then create a component that has a table that lists out the bowlers. Use both of those components in the App component to display the required info.

NOTE: Only display bowlers who are on the Marlins or Sharks teams.

**Submit your PUBLIC GitHub link in Learning Suite.**
